Preface

This document provides an introduction to Berkovich spaces, a fundamental concept in non-archimedean analytic geometry. The theory of Berkovich spaces offers a powerful framework for studying analytic varieties over non-archimedean valued fields, providing a geometric approach that bridges algebraic and analytic methods.

The main references are [[Ber90](#); [BGR84](#)].

Chapter 1

Commutative banach algebras

1.1 Semi-normed Rings and Modules

1.1.1 Semi-normed algebraic structures

Definition 1.1.1. Let M be an abelian group. A *semi-norm* on M is a function $\|\cdot\| : M \rightarrow \mathbb{R}_+$ such that

- $\|0\| = 0$;
- $\forall x, y \in M, \|x + y\| \leq \|x\| + \|y\|$.

If we further have $\|x\| = 0 \iff x = 0$, then we say $\|\cdot\|$ is a *norm*. A *semi-normed abelian group* (resp. *normed abelian group*) is an abelian group equipped with a semi-norm (resp. norm).

Definition 1.1.2. Let $\|\cdot\|_1$ and $\|\cdot\|_2$ be two semi-norms on an abelian group M . We say $\|\cdot\|_1$ is *bounded* by $\|\cdot\|_2$ if there exists a constant $C > 0$ such that $\forall x \in M, \|x\|_1 \leq C\|x\|_2$.

Remark 1.1.3. If two semi-norms (resp. norms) on an abelian group M are bounded by each other, then they induce the same topology on M .

Definition 1.1.4. Let M be a semi-normed abelian group and $N \subseteq M$ be a subgroup. The *residue semi-norm* on the quotient group M/N is defined as

$$\|x + N\|_{M/N} = \inf_{y \in N} \|x + y\|.$$

Remark 1.1.5. The residue semi-norm is a norm if and only if N is closed in M .

Definition 1.1.6. Let M and N be two semi-normed abelian groups. A group homomorphism $f : M \rightarrow N$ is called *bounded* if there exists a constant $C > 0$ such that $\forall x \in M, \|f(x)\|_N \leq C\|x\|_M$. A bounded homomorphism $f : M \rightarrow N$ is called *admissible* if the induced isomorphism $M/\ker f \rightarrow \text{Im } f$ is an isometry, i.e., $\forall x \in M, \|f(x)\|_N = \inf_{y \in \ker f} \|x + y\|_M$.

Definition 1.1.7. Let R be a ring (commutative with unity). A *semi-norm* on R is a semi-norm $\|\cdot\|$ on the underlying abelian group of R such that $\forall x, y \in R, \|xy\| \leq \|x\|\|y\|$ and $\|1\| = 1$. A *semi-normed ring* is a ring equipped with a semi-norm.

Definition 1.1.8. A semi-norm $\|\cdot\|$ on a ring R is called *multiplicative* if $\forall x, y \in R, \|xy\| = \|x\|\|y\|$. It is called *power-multiplicative* if $\forall x \in R, \|x^n\| = \|x\|^n$ for all integers $n \geq 1$.

Definition 1.1.9. Let $(R, \|\cdot\|_R)$ be a normed ring. A *semi-normed R -module* is a pair $(M, \|\cdot\|_M)$ where M is an R -module and $\|\cdot\|_M$ is a semi-norm on the underlying abelian group of M such that there exists $C > 0$ with $\forall a \in R, x \in M, \|ax\|_M \leq C\|a\|_R\|x\|_M$.

One can talk about boundedness, admissibility and residue semi-norms in the contexts of semi-normed rings and semi-normed modules similar to those in semi-normed abelian groups.

1.1.2 banach rings

Definition 1.1.10. A (semi-)norm on an abelian group M induces a (pseudo-)metric $d(x, y) = \|x - y\|$ on M . A (semi-)normed abelian group M is called *complete* if it is complete as a (pseudo-)metric space.

Definition 1.1.11. A *banach ring* is a complete normed ring.

Definition 1.1.12. Let $(A, \|\cdot\|_A)$ be a (semi-)normed algebraic structure, e.g., a (semi-)normed abelian group, a (semi-)normed ring, or a (semi-)normed module. The *completion* of A , denoted by \hat{A} , is the completion of A as a (pseudo-)metric space. Since A is dense in its completion, the algebraic operations and (semi-)norms on A can be uniquely extended to the completion.

Let R be a normed ring and M, N be semi-normed R -modules. There is a natural semi-norm on the tensor product $M \otimes_R N$ defined as

$$\|z\|_{M \otimes_R N} = \inf \left\{ \sum_i \|x_i\|_M \|y_i\|_N : z = \sum_i x_i \otimes y_i, x_i \in M, y_i \in N \right\}.$$

Definition 1.1.13. Let R be a complete normed ring and M, N complete semi-normed R -modules. The *complete tensor product* $M \hat{\otimes}_R N$ is defined as the completion of the semi-normed R -module $M \otimes_R N$.

Definition 1.1.14. Let R be a banach ring. For each $f \in R$, the *spectral radius* of f is defined as

$$\rho(f) = \lim_{n \rightarrow \infty} \|f^n\|^{1/n}.$$

Yang: Since , $\rho(f)$ exists.

Definition 1.1.15. A banach ring R is called *uniform* if its norm is power-multiplicative.

Proposition 1.1.16. Let $(R, \|\cdot\|)$ be a banach ring. The spectral radius $\rho(\cdot)$ defines a power-multiplicative semi-norm on R that is bounded by $\|\cdot\|$.

Proof. Yang: To be continued. □

Definition 1.1.17. Let R be a banach ring. An element $f \in R$ is called *quasi-nilpotent* if $\rho(f) = 0$. All quasi-nilpotent elements of R form an ideal, denoted by $\text{Qnil}(R)$.

Definition 1.1.18. Let R be a banach ring. The *uniformization* of R , denoted by $R \rightarrow R^u$, is the banach ring with the universal property among all bounded homomorphisms from R to uniform banach rings. Yang: To be continued.

Proposition 1.1.19. Let R be a banach ring. The completion of $R/\text{Qnil}(R)$ with respect to the spectral radius $\rho(\cdot)$ is the uniformization of R .

Proof. Yang: To be continued. □

1.1.3 Complete field

Definition 1.1.20. A multiplicative norm on a field is also called an *absolute value*. A *valuation field* is a field equipped with an absolute value.

Remark 1.1.21. Let \mathbf{k} be a field. Recall that a *valuation* on \mathbf{k} is a function $v : \mathbf{k}^\times \rightarrow \mathbb{R}$ such that

- $\forall x, y \in \mathbf{k}^\times, v(xy) = v(x) + v(y)$;
- $\forall x, y \in \mathbf{k}^\times, v(x + y) \geq \min\{v(x), v(y)\}$.

We can extend v to the whole field \mathbf{k} by defining $v(0) = +\infty$. Fix a real number $\varepsilon \in (0, 1)$. Then v induces an absolute value $|\cdot|_v : \mathbf{k} \rightarrow \mathbb{R}_+$ defined by $|x|_v = \varepsilon^{v(x)}$ for each $x \in \mathbf{k}$.

In some literature, the valuation v is called an *additive valuation* and the induced absolute value $|\cdot|_v$ is called a *multiplicative valuation*. In this note, the term *valuation* always refers to the additive valuation.

Definition 1.1.22. A valuation field $(\mathbf{k}, |\cdot|)$ is called *non-Archimedean* if $\forall x, y \in \mathbf{k}, |x + y| \leq \max\{|x|, |y|\}$, i.e., the norm satisfies the ultrametric inequality. Otherwise, it is called *Archimedean*.

Definition 1.1.23. A *complete field* is a valuation field which is complete as a metric space.

Lemma 1.1.24. Let \mathbf{k} be a non-Archimedean complete field. Then the set $\mathbf{k}^\circ = \{x \in \mathbf{k} : |x| \leq 1\}$ is a subring of \mathbf{k} , which is a local ring. Moreover, the set $\mathbf{k}^{\circ\circ} = \{x \in \mathbf{k} : |x| < 1\}$ is the maximal ideal of \mathbf{k}° .

Definition 1.1.25. Let \mathbf{k} be a non-Archimedean complete field. The subring \mathbf{k}° is called the *ring of integers* of \mathbf{k} . The set $\mathbf{k}^{\circ\circ} = \{x \in \mathbf{k} : |x| < 1\}$ is the maximal ideal of \mathbf{k}° . The residue field $\hat{\mathbf{k}} = \mathbf{k}^\circ / \mathbf{k}^{\circ\circ}$ is called the *residue field* of \mathbf{k} . Yang: To be revised.

1.1.4 Examples

Example 1.1.26. Let R be arbitrary ring. The *trivial norm* on R is defined as $\|x\| = 0$ if $x = 0$ and $\|x\| = 1$ if $x \neq 0$. The ring R equipped with the trivial norm is a normed ring.

Example 1.1.27. The fields \mathbb{C} and \mathbb{R} equipped with the usual absolute value are complete fields.

Example 1.1.28. The field \mathbb{Q}_p of p -adic numbers equipped with the p -adic norm is a complete non-Archimedean field.

Example 1.1.29. Let R be a banach ring and $r > 0$ be a real number. We define the ring of absolutely convergent power series over \mathbf{k} with radius r as

$$R\langle T/r \rangle := \left\{ \sum_{n=0}^{\infty} a_n T^n \in R[[T]] : \sum_{n=0}^{\infty} \|a_n\| r^n < \infty \right\}.$$

Equipped with the norm $\|\sum_{n=0}^{\infty} a_n T^n\| = \sum_{n=0}^{\infty} \|a_n\| r^n$, the ring $R\langle T/r \rangle$ is a banach ring.

When $R = \mathbf{k}$ is a **Yang: To be checked.**

Example 1.1.30. Let \mathbf{k} be a non-Archimedean complete field. We define

$$\mathbf{k}\{T_1/r_1, \dots, T_n/r_n\} := \left\{ \sum_{I \in \mathbb{N}^n} a_I T^I \in \mathbf{k}[[T_1, \dots, T_n]] : \lim_{|I| \rightarrow \infty} |a_I| r^I = 0 \right\},$$

where $r = (r_1, \dots, r_n)$ is an n -tuple of positive real numbers, $T^I = T_1^{i_1} \dots T_n^{i_n}$ for $I = (i_1, \dots, i_n)$, and $|I| = i_1 + \dots + i_n$. Equipped with the norm $\|\sum_{I \in \mathbb{N}^n} a_I T^I\| = \sup_{I \in \mathbb{N}^n} |a_I| r^I$, the affinoid \mathbf{k} -algebra $\mathbf{k}\{T_1/r_1, \dots, T_n/r_n\}$ is a banach \mathbf{k} -algebra. This is called the *Tate algebra* over \mathbf{k} with polyradius r equipped with the *Gauss norm*. We will denote $\mathbf{k}\{\underline{T}/r\} = \mathbf{k}\{T_1/r_1, \dots, T_n/r_n\}$ for simplicity.

Yang: To be continued...

1.2 Affinoid algebras

1.2.1 The first properties

Definition 1.2.1. Let \mathbf{k} be a non-archimedean field. A banach \mathbf{k} -algebra A is called a *affinoid \mathbf{k} -algebra* if there exists an admissible surjective homomorphism

$$\varphi : \mathbf{k}\{r_1^{-1}T_1, \dots, r_n^{-1}T_n\} \twoheadrightarrow A$$

for some $n \in \mathbb{N}$ and $r_1, \dots, r_n \in \mathbb{R}_{>0}$.

If one can choose $r_1 = \dots = r_n = 1$, then we say that A is a *strict affinoid \mathbf{k} -algebra*.

Definition 1.2.2. Let \mathbf{k} be a non-archimedean field. We define the *ring of restricted Laurent series* over \mathbf{k} as

$$\mathbf{K}_r = \mathbf{L}_{\mathbf{k},r} = \left\{ \sum_{n \in \mathbb{Z}} a_n T^n : a_n \in \mathbf{k}, \lim_{|n| \rightarrow \infty} |a_n| r^n = 0 \right\}$$

equipped with the norm

$$\|f\| = \sup_{n \in \mathbb{Z}} |a_n| r^n.$$

Yang: Is \mathbf{K}_r always a field? Yang: Do we have $\mathbf{L}_{\mathbf{k},r} = \text{Frac}(\mathbf{k}\{T/r\})$?

Proposition 1.2.3. Let \mathbf{k} be a non-archimedean field. If $r \notin \sqrt{|\mathbf{k}^\times|}$, then \mathbf{K}_r is a complete non-archimedean field with non-trivial absolute value extending that of \mathbf{k} .

Proposition 1.2.4. Let A be an affinoid \mathbf{k} -algebra. Then A is noetherian, and every ideal of A is closed.

Proposition 1.2.5. Let A be an affinoid \mathbf{k} -algebra. Then there exists a constant $C > 0$ and $N > 0$ such that for all $f \in A$ and $n \geq N$, we have

$$\|f^n\| \leq C \rho(f)^n.$$

Proposition 1.2.6. Let A be an affinoid \mathbf{k} -algebra. If and only if $\rho(f) \in \sqrt{|\mathbf{k}|}$ for all $f \in A$, then A is strict. Yang: To be complete.

1.2.2 Finite banach module

There are three different categories of finite modules over an affinoid algebra A :

- The category \mathbf{Banmod}_A of finite banach A -modules with A -linear maps as morphisms.
- The category \mathbf{Banmod}_A^b of finite banach A -modules with bounded A -linear maps as morphisms.
- The category \mathbf{mod}_A of finite A -modules with all A -linear maps as morphisms.

Theorem 1.2.7. Let A be an affinoid \mathbf{k} -algebra. Then the category of finite banach A -modules with bounded A -linear maps as morphisms is equivalent to the category of finite A -modules with A -linear maps as morphisms. Yang: To be revised.

For simplicity, we will just write \mathbf{mod}_A to denote the category of finite banach A -modules with bounded A -linear maps as morphisms.

DRAFT

Chapter 2

Affinoid spaces

2.1 Spectrum

Let \mathbf{k} be a spherically complete non-archimedean field which is algebraically closed and $A = \mathbf{k}[T]$. We want to consider the “analytic structure” on $\mathbf{mSpec} A$. However, unlike the complex case, the set $\mathbf{mSpec} A$ is totally disconnected with respect to the topology induced by the absolute value on \mathbf{k} (Proposition A.2.3). To overcome this difficulty, Berkovich uses multiplicative semi-norms to “fill in the gaps” between the points in $\mathbf{mSpec} A$, leading to the notion of the spectrum of a Banach ring.

We first consider the local model. Hence we should consider the Tate algebra $\mathbf{k}\{T\}$ instead of the polynomial ring $\mathbf{k}[T]$. Yang: The maximal ideal of $\mathbf{k}\{T\}$ corresponding to the point in the disk $\{a \in \mathbf{k} : a \leq 1\}$. Yang: Closed or open disk?

2.1.1 Definition

Definition 2.1.1. Let R be a Banach ring. The *spectrum* $\mathcal{M}(R)$ of R is defined as the set of all multiplicative semi-norms on R that are bounded with respect to the given norm on R . For every point $x \in \mathcal{M}(R)$, we denote the corresponding multiplicative semi-norm by $|\cdot|_x$. We equip $\mathcal{M}(R)$ with the weakest topology such that for each $f \in R$, the evaluation map $\mathcal{M}(R) \rightarrow \mathbb{R}_{\geq 0}$, defined by $x \mapsto |f|_x =: f(x)$, is continuous.

Definition 2.1.2. Let $\varphi : R \rightarrow S$ be a bounded ring homomorphism of Banach rings. The *pullback* map $\mathcal{M}(\varphi) : \mathcal{M}(S) \rightarrow \mathcal{M}(R)$ is defined by $\mathcal{M}(\varphi)(x) = x \circ \varphi : f \mapsto |\varphi(f)|_x$ for each $x \in \mathcal{M}(S)$.

Proposition 2.1.3. Let R be a Banach ring. For each $x \in \mathcal{M}(R)$, let \wp_x be the kernel of the multiplicative semi-norm $|\cdot|_x$. Then \wp_x is a closed prime ideal of R , and $x \mapsto \wp_x$ defines a continuous map from $\mathcal{M}(R)$ to $\text{Spec}(R)$ equipped with the Zariski topology.

| *Proof.* Yang: To be completed □

Definition 2.1.4. Let R be a Banach ring. For each $x \in \mathcal{M}(R)$, the *completed residue field* at the point x is defined as the completion of the residue field $\kappa(x) = \text{Frac}(R/\wp_x)$ with respect to the multiplicative norm induced by the semi-norm $|\cdot|_x$, denoted by $\mathcal{H}(x)$.

Definition 2.1.5. Let R be a Banach ring. The *Gel'fand transform* of R is the bounded ring homomorphism

$$\Gamma : R \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x), \quad f \mapsto (f(x))_{x \in \mathcal{M}(R)},$$

where the norm on the product $\prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$ is given by the supremum norm.

Proposition 2.1.6. The Gel'fand transform $\Gamma : R \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$ of a Banach ring R factors through the uniformization R^u of R , and the induced map $R^u \rightarrow \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$ is an isometric embedding. **Yang: To be checked.**

Theorem 2.1.7. Let R be a Banach ring. The spectrum $\mathcal{M}(R)$ is a nonempty compact Hausdorff space.

Proof. **Yang: To be continued.** □

Lemma 2.1.8. Let $\{K_i\}_{i \in I}$ be a family of completed fields. Consider the Banach ring $R = \prod_{i \in I} K_i$ equipped with the product norm. The spectrum $\mathcal{M}(R)$ is homeomorphic to the Stone-Čech compactification of the discrete space I .

Remark 2.1.9. The Stone-Čech compactification of a discrete space is the largest compact Hausdorff space in which the original space can be densely embedded. **Yang: To be checked.**

Proposition 2.1.10. Let K/k be a Galois extension of complete fields, and let R be a Banach k -algebra. The Galois group $\text{Gal}(K/k)$ acts on the spectrum $\mathcal{M}(R \hat{\otimes}_k K)$ via

$$g \cdot x : f \mapsto |(1 \otimes g^{-1})(f)|_x$$

for each $g \in \text{Gal}(K/k)$, $x \in \mathcal{M}(R \hat{\otimes}_k K)$ and $f \in R \hat{\otimes}_k K$. Moreover, the natural map $\mathcal{M}(R \hat{\otimes}_k K) \rightarrow \mathcal{M}(R)$ induces a homeomorphism

$$\mathcal{M}(R \hat{\otimes}_k K) / \text{Gal}(K/k) \xrightarrow{\sim} \mathcal{M}(R).$$

Yang: To be checked.

2.1.2 Examples

Example 2.1.11. Let $(\mathbf{k}, |\cdot|)$ be a complete valuation field. The spectrum $\mathcal{M}(\mathbf{k})$ consists of a single point corresponding to the given absolute value $|\cdot|$ on \mathbf{k} . **Yang: To be checked.**

Example 2.1.12. Consider the Banach ring $(\mathbb{Z}, \|\cdot\|)$ with $\|\cdot\| = |\cdot|_\infty$ is the usual absolute value norm on \mathbb{Z} . Let $|\cdot|_p$ denote the p -adic norm for each prime number p , i.e., $|n|_p = p^{-v_p(n)}$ for each $n \in \mathbb{Z}$, where $v_p(n)$ is the p -adic valuation of n . The spectrum

$$\mathcal{M}(\mathbb{Z}) = \{|\cdot|_\infty^\varepsilon : \varepsilon \in (0, 1]\} \cup \{|\cdot|_p^\alpha : p \text{ is prime}, \alpha \in (0, \infty]\} \cup \{|\cdot|_0\},$$

where $|a|_p^\infty := \lim_{\alpha \rightarrow \infty} |a|_p^\alpha$ for each $a \in \mathbb{Z}$ and $|\cdot|_0$ is the trivial norm on \mathbb{Z} . **Yang: To be checked.**

Spectrum of Tate algebra in one variable Let \mathbf{k} be a complete non-archimedean field, and let $A = \mathbf{k}\{T/r\}$. We list some types of points in the spectrum $\mathcal{M}(A)$.

For each $a \in \mathbf{k}$ with $|a| \leq r$, we have the *type I* point x_a corresponding to the evaluation at a , i.e., $|f|_{x_a} := |f(a)|$ for each $f \in A$. For each closed disk $E = E(a, s) := \{b \in \mathbf{k} : |b - a| \leq s\}$ with center $a \in \mathbf{k}$ and radius $s \leq r$, we have the point $x_{a,s}$ corresponding to the multiplicative semi-norm defined by

$$|f|_{x_E} := \sup_{b \in E(a,s)} |f(b)|$$

for each $f \in A$. If $s \in |\mathbf{k}^\times|$, then the point x_E is called a *type II* point; otherwise, it is called a *type III* point.

Let $\{E^{(s)}\}_s$ be a family of closed disks in \mathbf{k} such that $E^{(s)}$ is of radius s , $E^{(s_1)} \subsetneq E^{(s_2)}$ for any $s_1 < s_2$ and $\bigcap_s E^{(s)} = \emptyset$. Then we have the point $x_{\{E^{(s)}\}}$ corresponding to the multiplicative semi-norm defined by

$$|f|_{x_{\{E^{(s)}\}}} := \inf_s |f|_{x_{E^{(s)}}}$$

for each $f \in A$. Such a point is called a *type IV* point.

Yang: To be completed.

Proposition 2.1.13. Let \mathbf{k} be a complete non-archimedean field, and let $r > 0$ be a positive real number. Consider the Tate algebra $\mathbf{k}\{r^{-1}T\}$ equipped with the Gauss norm. The points in the spectrum $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$ can be classified into four types as described above. Yang: To be checked

Proof. Yang: To be completed. □

Proposition 2.1.14. Let \mathbf{k} be a complete non-archimedean field, and let $r > 0$ be a positive real number. Consider the Tate algebra $\mathbf{k}\{r^{-1}T\}$ equipped with the Gauss norm. The completed residue fields of the four types of points in the spectrum $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$ are described as follows:

- For a type I point x_a with $a \in \mathbf{k}$ and $|a| \leq r$, the completed residue field $\mathcal{H}(x_a)$ is isomorphic to \mathbf{k} .
- For a type II point $x_{a,s}$ with $a \in \mathbf{k}$ and $s \in |\mathbf{k}^\times|$, the completed residue field $\mathcal{H}(x_{a,s})$ is isomorphic to the field of Laurent series over the residue field $\mathbf{k}_{\mathbf{k}}$, i.e., $\mathbf{k}_{\mathbf{k}}((t))$.
- For a type III point $x_{a,s}$ with $a \in \mathbf{k}$ and $s \notin |\mathbf{k}^\times|$, the completed residue field $\mathcal{H}(x_{a,s})$ is isomorphic to a transcendental extension of $\mathbf{k}_{\mathbf{k}}$ of degree one.
- For a type IV point $x_{\{E^{(s)}\}}$, the completed residue field $\mathcal{H}(x_{\{E^{(s)}\}})$ is isomorphic to a transcendental extension of $\mathbf{k}_{\mathbf{k}}$ of infinite degree.

Yang: To be checked.

Example 2.1.15. The completed residue field $\mathcal{H}(x_a)$ for a type I point x_a with $a \in \mathbf{k}$ and $|a| \leq r$ is isomorphic to \mathbf{k} . Yang: To be complete.

2.2 Affinoid domains

Consider $X = \mathcal{M}(A)$ with $A = \mathbf{k}\{T_1, \dots, T_n\}$. Yang: Not every open subset of X gives an affinoid space, that is, the completion of the ring of analytic functions on that open subset is not necessarily an affinoid algebra. Yang: Right? example?

2.2.1 Definition

Definition 2.2.1. Let A be a \mathbf{k} -affinoid algebra, and let $X = \mathcal{M}(A)$ be the associated affinoid space. A closed subset $V \subseteq X$ is called an *affinoid domain* if there exists a \mathbf{k} -affinoid algebra A_V and a morphism of \mathbf{k} -affinoid algebras $\varphi : A \rightarrow A_V$ satisfying the following universal property: for every bounded homomorphism of \mathbf{k} -affinoid algebras $\psi : A \rightarrow B$ such that the induced map on spectra $\mathcal{M}(\psi) : \mathcal{M}(B) \rightarrow X$ has its image contained in V , there exists a unique bounded homomorphism $\theta : A_V \rightarrow B$ such that the following diagram commutes:

$$\begin{array}{ccc} & A_V & \\ \varphi \nearrow & & \searrow \theta \\ A & \xrightarrow{\psi} & B \end{array}$$

In this case, we say that V is represented by the affinoid algebra A_V .

Slogan A closed subset $V \subset X$ is an affinoid domain if the functor “ $\text{Mor}(-, V)$ ” is representable.

Yang: Why we consider closed subset rather than open subset?

Construction 2.2.2. Let $f = (f_1, \dots, f_n)$ be a tuple of elements in A and $r = (r_1, \dots, r_n)$ be a tuple of positive real numbers. Consider the closed subset of X :

$$X(\underline{f/r}) := \{x \in X : |f_i(x)| \leq r_i, 1 \leq i \leq n\}.$$

Such a closed subset is called a *Weierstrass domain* of X . Moreover, we can define a \mathbf{k} -affinoid algebra

$$A\{\underline{f/r}\} := A\{f_1/r_1, \dots, f_n/r_n\}.$$

Yang: The domain $X(\underline{f/r})$ is represented by $A\{\underline{f/r}\}$.

Construction 2.2.3. Let $f = (f_1, \dots, f_n), g = (g_1, \dots, g_m)$ be two tuples of elements in A and $r = (r_1, \dots, r_n), s = (s_1, \dots, s_m)$ be two tuples of positive real numbers. Consider the following closed subset of X :

$$X(\underline{f/r}; \underline{g/s}^{-1}) := \{x \in X : |f_i(x)| \leq r_i, |g_j(x)| \geq s_j, 1 \leq i \leq n, 1 \leq j \leq m\}.$$

Such a closed subset is called a *Laurent domain* of X . Moreover, we can define a \mathbf{k} -affinoid algebra

$$A\{\underline{f/r}; \underline{g/s}^{-1}\} := A\{f_1/r_1, \dots, f_n/r_n, g_1^{-1}/s_1, \dots, g_m^{-1}/s_m\}.$$

Yang: The domain $X(\underline{f/r}; \underline{g/s}^{-1})$ is represented by $A\{\underline{f/r}; \underline{g/s}^{-1}\}$.

Construction 2.2.4. Let $f = (f_1, \dots, f_n), g$ be elements in A such that the ideal generated by them is the whole algebra A . Set $p = (p_1, \dots, p_n)$ be a tuple of positive real numbers. We define the following closed subset of X :

$$X(\underline{f/p}, g) := \{x \in X : |f_i(x)| \leq p_i |g(x)|, 1 \leq i \leq n\}.$$

Such a closed subset is called a *rational domain* of X . Moreover, we can define a \mathbf{k} -affinoid algebra

$$A\langle \underline{f/p}, g^{-1} \rangle := A\left\langle \frac{f_1}{p_1 g}, \dots, \frac{f_n}{p_n g} \right\rangle,$$

which is the quotient of the Tate algebra

$$A\langle T_1, \dots, T_n \rangle$$

by the ideal generated by the elements $p_i g T_i - f_i$ for $1 \leq i \leq n$. There is a natural bounded homomorphism $\varphi : A \rightarrow A\langle \underline{f/p}, g^{-1} \rangle$ induced by the inclusion. It can be shown that the closed subset $X(\underline{f/p}, g)$ is an affinoid domain represented by the affinoid algebra $A\langle \underline{f/p}, g^{-1} \rangle$. **Yang: To be checked**

Yang: We have a sequence of inclusion:

$$\{\text{Weierstrass domains}\} \subseteq \{\text{Laurent domains}\} \subseteq \{\text{Rational domains}\} \subseteq \{\text{Affinoid domains}\}.$$

Proposition 2.2.5. Let A be a \mathbf{k} -affinoid algebra, and let $X = \mathcal{M}(A)$ be the associated affinoid space. Let $V \subseteq X$ be an affinoid domain represented by the \mathbf{k} -affinoid algebra A_V . Then the natural bounded homomorphism $\varphi : A \rightarrow A_V$ is flat.

We have $\mathcal{M}(A_V) \cong V$.

Non-archimedean analysis

A.1 Valuation fields

Definition A.1.1. Let \mathbf{k} be a field. An *absolute value* on \mathbf{k} is a function $\|\cdot\| : \mathbf{k} \rightarrow \mathbb{R}_{\geq 0}$ satisfying the following properties for all $x, y \in \mathbf{k}$:

- (a) $\|x\| = 0$ if and only if $x = 0$;
- (b) $\|xy\| = \|x\| \cdot \|y\|$;
- (c) $\|x + y\| \leq \|x\| + \|y\|$.

A field \mathbf{k} equipped with an absolute value $\|\cdot\|$ is called a *valuation field*.

Remark A.1.2. Let \mathbf{k} be a field. Recall that a *valuation* on \mathbf{k} is a function $v : \mathbf{k}^\times \rightarrow \mathbb{R}$ such that

- $\forall x, y \in \mathbf{k}^\times, v(xy) = v(x) + v(y)$;
- $\forall x, y \in \mathbf{k}^\times, v(x + y) \geq \min\{v(x), v(y)\}$.

We can extend v to the whole field \mathbf{k} by defining $v(0) = +\infty$. Fix a real number $\varepsilon \in (0, 1)$. Then v induces an absolute value $|\cdot|_v : \mathbf{k} \rightarrow \mathbb{R}_+$ defined by $|x|_v = \varepsilon^{v(x)}$ for each $x \in \mathbf{k}$.

In some literature, the valuation v is called an *additive valuation* and the induced absolute value $|\cdot|_v$ is called a *multiplicative valuation*. In this note, the term *valuation* always refers to the additive valuation.

Definition A.1.3. Let $(\mathbf{k}, \|\cdot\|)$ be a valuation field. We say that \mathbf{k} is *complete* if the metric $d(x, y) := \|x - y\|$ makes \mathbf{k} a complete metric space.

Lemma A.1.4. Let $(\mathbf{k}, \|\cdot\|)$ be a valuation field. Let $(\hat{\mathbf{k}}, \|\cdot\|)$ be its completion as a metric space. Then the operations of addition and multiplication on \mathbf{k} can be extended to $\hat{\mathbf{k}}$ uniquely, making $(\hat{\mathbf{k}}, \|\cdot\|)$ a complete valuation field containing \mathbf{k} as a dense subfield.

Definition A.1.5. A valuation field $(\mathbf{k}, \|\cdot\|)$ is called *spherically complete* if every decreasing sequence of closed balls in \mathbf{k} has a non-empty intersection.

A.2 Ultra-metric spaces

Definition A.2.1. A metric space (X, d) is called an *ultra-metric space* if its metric d satisfies the *strong triangle inequality*:

$$d(x, z) \leq \max\{d(x, y), d(y, z)\}, \quad \forall x, y, z \in X.$$

Proposition A.2.2. Let (X, d) be an ultra-metric space. Then for any $x \in X$ and $r > 0$, the closed ball $B(x, r) := \{y \in X : d(x, y) \leq r\}$ satisfies the following properties:

- (a) For any $y \in B(x, r)$, we have $B(x, r) = B(y, r)$.
- (b) Any two closed balls in X are either disjoint or one is contained in the other.

Yang: To be revised.

We will use $B(x, r)$ to denote the open ball with center x and radius r . We will use $E(x, r)$ to denote the closed ball with center x and radius r .

Proposition A.2.3. Let (X, d) be an ultra-metric space. Then X is totally disconnected, i.e., the only connected subsets of X are the singletons. Yang: To be revised.
