## Spectrum

Let  $\mathbf{k}$  be a spherically complete non-archimedean field which is algebraically closed and  $A = \mathbf{k}[T]$ . We want to consider the "analytic structure" on  $\mathbf{mSpec}\,A$ . However, unlike the complex case, the set  $\mathbf{mSpec}\,A$  is totally disconnected with respect to the topology induced by the absolute value on  $\mathbf{k}$  (??). To overcome this difficulty, Berkovich uses multiplicative semi-norms to "fill in the gaps" between the points in  $\mathbf{mSpec}\,A$ , leading to the notion of the spectrum of a Banach ring.

We first consider the local model. Hence we should consider the Tate algebra  $\mathbf{k}\{T\}$  instead of the polynomial ring  $\mathbf{k}[T]$ . Yang: The maximal ideal of  $\mathbf{k}\{T\}$  corresponding to the point in the disk  $\{a \in \mathbf{k} : a \leq 1\}$ . Yang: Closed or open disk?

## 1 Definition

**Definition 1.** Let R be a Banach ring. The *spectrum*  $\mathcal{M}(R)$  of R is defined as the set of all multiplicative semi-norms on R that are bounded with respect to the given norm on R. For every point  $x \in \mathcal{M}(R)$ , we denote the corresponding multiplicative semi-norm by  $|\cdot|_x$ . We equip  $\mathcal{M}(R)$  with the weakest topology such that for each  $f \in R$ , the evaluation map  $\mathcal{M}(R) \to \mathbb{R}_{\geq 0}$ , defined by  $x \mapsto |f|_x = f(x)$ , is continuous.

**Definition 2.** Let  $\varphi : R \to S$  be a bounded ring homomorphism of Banach rings. The *pullback* map  $\mathcal{M}(\varphi) : \mathcal{M}(S) \to \mathcal{M}(R)$  is defined by  $\mathcal{M}(\varphi)(x) = x \circ \varphi : f \mapsto |\varphi(f)|_x$  for each  $x \in \mathcal{M}(S)$ .

**Proposition 3.** Let R be a Banach ring. For each  $x \in \mathcal{M}(R)$ , let  $\mathcal{P}_x$  be the kernel of the multiplicative semi-norm  $|\cdot|_x$ . Then  $\mathcal{P}_x$  is a closed prime ideal of R, and  $x \mapsto \mathcal{P}_x$  defines a continuous map from  $\mathcal{M}(R)$  to Spec(R) equipped with the Zariski topology.

Proof. Yang: To be completed

**Definition 4.** Let R be a Banach ring. For each  $x \in \mathcal{M}(R)$ , the completed residue field at the point x is defined as the completion of the residue field  $\kappa(x) = \operatorname{Frac}(R/\wp_x)$  with respect to the multiplicative norm induced by the semi-norm  $|\cdot|_x$ , denoted by  $\mathcal{H}(x)$ .

**Definition 5.** Let R be a Banach ring. The *Gel'fand transform* of R is the bounded ring homomorphism

$$\Gamma: R \to \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x), \quad f \mapsto (f(x))_{x \in \mathcal{M}(R)},$$

where the norm on the product  $\prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  is given by the supremum norm.

**Proposition 6.** The Gel'fand transform  $\Gamma: R \to \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  of a Banach ring R factors through the uniformization  $R^u$  of R, and the induced map  $R^u \to \prod_{x \in \mathcal{M}(R)} \mathcal{H}(x)$  is an isometric embedding. Yang: To be checked.

Date: October 26, 2025, Author: Tianle Yang, My Homepage

**Theorem 7.** Let R be a Banach ring. The spectrum  $\mathcal{M}(R)$  is a nonempty compact Hausdorff space.

Proof. Yang: To be continued.

**Lemma 8.** Let  $\{K_i\}_{i\in I}$  be a family of completed fields. Consider the Banach ring  $R=\prod_{i\in I}K_i$  equipped with the product norm. The spectrum  $\mathcal{M}(R)$  is homeomorphic to the Stone-Čech compactification of the discrete space I.

Remark 9. The Stone-Čech compactification of a discrete space is the largest compact Hausdorff space in which the original space can be densely embedded. Yang: To be checked.

**Proposition 10.** Let K/k be a Galois extension of complete fields, and let R be a Banach k-algebra. The Galois group  $\operatorname{Gal}(K/k)$  acts on the spectrum  $\mathcal{M}(R \widehat{\otimes}_k K)$  via

$$g\cdot x: f\mapsto |(1\otimes g^{-1})(f)|_x$$

for each  $g \in \operatorname{Gal}(K/k)$ ,  $x \in \mathcal{M}(R \widehat{\otimes}_k K)$  and  $f \in R \widehat{\otimes}_k K$ . Moreover, the natural map  $\mathcal{M}(R \widehat{\otimes}_k K) \to \mathcal{M}(R)$  induces a homeomorphism

$$\mathcal{M}(R\widehat{\otimes}_k K)/\operatorname{Gal}(K/k) \xrightarrow{\sim} \mathcal{M}(R).$$

Yang: To be checked.

## 2 Examples

**Example 11.** Let  $(\mathbf{k}, |\cdot|)$  be a complete valuation field. The spectrum  $\mathcal{M}(\mathbf{k})$  consists of a single point corresponding to the given absolute value  $|\cdot|$  on  $\mathbf{k}$ . Yang: To be checked.

**Example 12.** Consider the Banach ring  $(\mathbb{Z}, \|\cdot\|)$  with  $\|\cdot\| = |\cdot|_{\infty}$  is the usual absolute value norm on  $\mathbb{Z}$ . Let  $|\cdot|_p$  denote the p-adic norm for each prime number p, i.e.,  $|n|_p = p^{-v_p(n)}$  for each  $n \in \mathbb{Z}$ , where  $v_p(n)$  is the p-adic valuation of n. The spectrum

$$\mathcal{M}(\mathbb{Z}) = \{|\cdot|_{\infty}^{\varepsilon} : \varepsilon \in (0,1]\} \cup \{|\cdot|_{p}^{\alpha} : p \text{ is prime}, \alpha \in (0,\infty]\} \cup \{|\cdot|_{0}\},$$

where  $|a|_p^{\infty} := \lim_{\alpha \to \infty} |a|_p^{\alpha}$  for each  $\alpha \in \mathbb{Z}$  and  $|\cdot|_0$  is the trivial norm on  $\mathbb{Z}$ . Yang: To be checked.

Spectrum of Tate algebra in one variable Let **k** be a complete non-archimedean field, and let  $A = \mathbf{k}\{T/r\}$ . We list some types of points in the spectrum  $\mathcal{M}(A)$ .

For each  $a \in \mathbf{k}$  with  $|a| \le r$ , we have the *type I* point  $x_a$  corresponding to the evaluation at a, i.e.,  $|f|_{x_a} := |f(a)|$  for each  $f \in A$ . For each closed disk  $E = E(a, s) := \{b \in \mathbf{k} : |b - a| \le s\}$  with center  $a \in \mathbf{k}$  and radius  $s \le r$ , we have the point  $x_{a,s}$  corresponding to the multiplicative semi-norm defined by

$$|f|_{x_E} := \sup_{b \in E(a,s)} |f(b)|$$

for each  $f \in A$ . If  $s \in |\mathbf{k}^{\times}|$ , then the point  $x_E$  is called a type II point; otherwise, it is called a type III point.

Let  $\{E^{(s)}\}_s$  be a family of closed disks in **k** such that  $E^{(s)}$  is of radius s,  $E^{(s_1)} \subseteq E^{(s_2)}$  for any  $s_1 < s_2$  and  $\bigcap_s E^{(s)} = \emptyset$ . Then we have the point  $x_{\{E^{(s)}\}}$  corresponding to the multiplicative semi-norm defined

3

by

$$|f|_{x_{\{E^{(s)}\}}} := \inf_{s} |f|_{x_{E^{(s)}}}$$

for each  $f \in A$ . Such a point is called a type IV point.

Yang: To be completed.

**Proposition 13.** Let **k** be a complete non-archimedean field, and let r > 0 be a positive real number. Consider the Tate algebra  $\mathbf{k}\{r^{-1}T\}$  equipped with the Gauss norm. The points in the spectrum  $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$  can be classified into four types as described above. Yang: To be checked

Proof. Yang: To be completed.

**Proposition 14.** Let **k** be a complete non-archimedean field, and let r > 0 be a positive real number. Consider the Tate algebra  $\mathbf{k}\{r^{-1}T\}$  equipped with the Gauss norm. The completed residue fields of the four types of points in the spectrum  $\mathcal{M}(\mathbf{k}\{r^{-1}T\})$  are described as follows:

- For a type I point  $x_a$  with  $a \in \mathbf{k}$  and  $|a| \leq r$ , the completed residue field  $\mathcal{H}(x_a)$  is isomorphic to  $\mathbf{k}$ .
- For a type II point  $x_{a,s}$  with  $a \in \mathbf{k}$  and  $s \in |\mathbf{k}^{\times}|$ , the completed residue field  $\mathcal{H}(x_{a,s})$  is isomorphic to the field of Laurent series over the residue field  $\mathcal{k}_{\mathbf{k}}$ , i.e.,  $\mathcal{k}_{\mathbf{k}}((t))$ .
- For a type III point  $x_{a,s}$  with  $a \in \mathbf{k}$  and  $s \notin |\mathbf{k}^{\times}|$ , the completed residue field  $\mathcal{H}(x_{a,s})$  is isomorphic to a transcendental extension of  $\mathcal{K}_{\mathbf{k}}$  of degree one.
- For a type IV point  $x_{\{E^{(s)}\}}$ , the completed residue field  $\mathcal{H}(x_{\{E^{(s)}\}})$  is isomorphic to a transcendental extension of  $\mathcal{K}_{\mathbf{k}}$  of infinite degree.

Yang: To be checked.

**Example 15.** The completed residue field  $\mathcal{H}(x_a)$  for a type I point  $x_a$  with  $a \in \mathbf{k}$  and  $|a| \leq r$  is isomorphic to  $\mathbf{k}$ . Yang: To be complete.
